IXIGO
USER RESEARCH

Interview synthesis and participant evidence

Project: Travel booking experience — train, bus, flight and hotel journeys

Research material: 20 audio interview records and 1 WhatsApp interview record

Prepared: 6 November 2026

Purpose

A project-ready qualitative research report consolidating the supplied interview material into participant summaries, cross-interview themes, UX opportunities and follow-up research questions. It is designed to support further product discovery and design work—not to represent a statistically representative survey.

Important evidence note: Several audio transcripts contain substantial speech-recognition errors. This report distinguishes stronger findings from tentative interpretations and does not reconstruct unintelligible speech as fact.

1. Executive summary

Across 21 interview records, the most prominent recurring topic is uncertainty around waitlisted train tickets and the role of confirmation-probability information in booking decisions. Several participants independently describe personal thresholds around 80%, 85–90% or above 90%. These are individual decision rules from a qualitative sample—not evidence of ixigo prediction accuracy or population-wide behaviour.

The interviews also reveal differences in platform behaviour. Some active users value ixigo's convenience, schedule information and multi-category travel options. Other participants remain IRCTC-first, use ixigo only to check information, or have reduced usage because of perceived complexity, login friction, charges or refund-term uncertainty.

A further opportunity is to connect disrupted train journeys with viable alternatives. Participants mention flights, buses, other trains, routes and Tatkal/Premium Tatkal as fallback options. The importance of these options varies by traveller: time, punctuality, comfort, safety, price and availability are not interchangeable priorities.

Top research signals

- **Confirmation confidence:** Users use probability information as a decision aid, but thresholds differ and some users report that a high prediction did not guarantee confirmation.
- **Trust and conversion:** Awareness or information use does not always translate into booking on ixigo; IRCTC familiarity and perceived official status can maintain the habit of booking elsewhere.
- **Booking friction:** Login difficulties and perceived complexity can reduce repeat use even when the user likes the interface or features.
- **Refund comprehension:** 3X Refund is valued by some participants, unknown to others, and potentially confusing where eligibility, cash/voucher form or redemption are unclear.
- **Alternative journeys:** Flights, buses, other trains and Tatkal options are considered when a preferred train is unavailable or uncertain.
- **Journey priorities:** Speed, punctuality, duration, comfort, safety, time and cost vary by participant and should be supported through flexible filters.

Scope and count

There are 21 interview records. Interview #07 (Diwakar Durlabh) and #12 (Durlabh) may refer to the same person; until identity is confirmed, the report retains both records but does not claim 21 unique participants. The likely unique count is therefore 20, pending deduplication.

2. Research scope and method

The supplied material consists of interviewer-led audio transcripts for 20 records and screenshots of a WhatsApp exchange for Mamta Singh. The interviews cover ixigo awareness and usage, train booking, waitlists/RAC, confirmation probability, IRCTC comparisons, 3X Refund, booking friction, travel priorities and backup plans.

How this report was prepared

- Responses were consolidated into participant-level summaries and themes.
- Clear statements were separated from uncertain speech-recognition fragments.
- Numeric references were retained only where their context was reasonably clear; ambiguous percentages are explicitly flagged.
- Paraphrases are used instead of invented verbatim quotations.
- Interviewer prompts are treated cautiously because some questions introduced features or suggested response options.

Evidence confidence labels

Label	Meaning
Good	The main response is understandable and can support a cautious qualitative finding.
Medium / Medium–Low	Some useful responses are recoverable, but details or context remain uncertain.
Low / Very Low	Transcript is substantially garbled; use only as an exploratory signal, not as firm evidence.

Research limitations

- This is a small qualitative sample, not a representative survey. Counts and percentages should not be used to estimate market prevalence.
- Audio transcription quality varies significantly. Some names, routes, dates, feature descriptions and numbers may be inaccurate.
- Interviewer prompts sometimes explain confirmation probability or 3X Refund before asking for a reaction, which can influence responses.
- The sample includes active users, occasional users, explorers and non-users; their experiences should not be blended into one satisfaction score.
- No direct product analytics, booking logs, prediction calibration data or refund-policy documentation were supplied.
- Participant workarounds involving general tickets or TTE enquiries are personal accounts, not official railway-policy guidance.

3. Cross-interview findings

A. Confirmation probability is a major decision aid

Several participants explicitly describe personal thresholds: Aditya around 85–90%; Ashish 80%+; Diwakar Durlabh around 80%; Priya 80%+; Sayantika around 80% (or 90% when urgent); Mamta above 90%. Anika, a non-user, also states an 80% threshold as a general booking rule. Sandeep describes preferring 90–95%. These examples suggest that users interpret probability as a practical booking signal. They do not validate the model's accuracy. Some participants also report or discuss a ticket failing to confirm despite a high prediction.

Design implication: show what the percentage means, its uncertainty and the difference between a prediction and a guarantee. Test whether users understand the range and what action they take at different values.

B. Platform familiarity and trust affect booking conversion

Avi Anika prefers IRCTC and has not booked through ixigo; Anika uses MakeMyTrip; Alok appears IRCTC-first; Abhilash says he books directly through IRCTC; Sushant and Durlabh appear to check information on ixigo but book elsewhere. Familiarity, perceived official status and established habits are plausible drivers. Do not assume a single reason applies to all.

Design implication: make booking legitimacy, payment flow, ticket issuance and support information clear. Investigate the specific moment users leave ixigo for another platform.

C. Usability friction can reduce repeat use

Yashveer says ixigo feels more complicated than IRCTC. Sandeep describes login/account friction as a reason for reduced usage while still liking the schedule UI. Other participants praise ixigo as smooth and user-friendly, showing that experience is not uniform.

Design implication: simplify the search-to-booking flow, make login recovery predictable and test the experience with users who are accustomed to IRCTC.

D. 3X Refund needs clear discovery and explanation

Ashish, Prince, Diwakar, Diwakar Durlabh and Sandeep discuss or value the feature. Aditya was unaware of it until it was introduced. Durlabh raises concerns around extra charges, refund form and voucher restrictions. Some comments are prompted by interviewer explanations.

Design implication: explain eligibility, exclusions, refund calculation, cash versus voucher form, expiry and redemption before purchase. Measure comprehension, not just awareness.

E. Users need a useful backup when train plans fail

Participants mention alternate trains/routes, flights, buses and Tatkal/Premium Tatkal. Mamta explicitly prefers a flight rather than spending time on Tatkal. Aditya considers flights or buses. Priya may try IRCTC/Premium Tatkal. Ashish prioritises duration and punctuality.

Design implication: present alternatives based on the user's actual priorities, not just a generic list. Clearly compare total journey time, departure/arrival, price and transfer/layover burden.

F. Journey priorities are personal and context-dependent

Aditya prioritises comfort and 2nd AC; Ashish prioritises duration and on-time performance; Anika prioritises punctuality; Priya prefers faster trains and avoids inconvenient layovers; Mamta names time, safety and comfort; Anup mentions suitable timing and availability.

Design implication: offer flexible filters and sorting rather than assuming price or speed is always the top criterion.

G. Festival and Tatkal scenarios create additional complexity

Festival-season alternatives and Tatkal/Premium Tatkal appear in several interviews, including Ashish, Priya, Sayantika, Amrish, Alok and Anup. The exact experiences vary and some audio is unclear.

Design implication: test peak-season discovery, alternative train suggestions, clear availability states and low-friction Tatkal journeys.

H. Train data freshness and status confidence matter

Ashish says he sometimes checks IRCTC because he has seen data discrepancies. Several interviews touch on PNR, chart preparation, RAC and waitlist status, though not all provide clear examples.

Design implication: communicate update timestamps and status provenance where possible; investigate discrepancies using operational data before changing the UI.

4. Participant-level interview records

The following summaries preserve the strongest recoverable information from each supplied record. They are not verbatim transcripts. Where audio was unclear, the summary explicitly avoids asserting an exact answer.

Interview 01: Shashikant Kumar

Evidence confidence: Low

What was heard: Railway ticket booking through ixigo and IRCTC was discussed. Waiting-list uncertainty and what to do if a ticket does not confirm appear to be central concerns. Exact usage pattern and detailed opinions are not recoverable from the noisy transcript.

Research use: Treat as exploratory evidence only. Potential needs: understandable waitlist status, timely PNR updates and practical alternative options.

Interview 02: Prince

Evidence confidence: Low

What was heard: Uses ixigo and mentioned recent use around the previous month. Train and hotel booking, bookings for family/friends, connecting journeys, confirmation percentage and 3X Refund were discussed. The transcript suggests a positive overall view, but many answers are garbled.

Research use: Investigate family booking, connecting-journey discovery and clear explanation of confirmation probability and 3X Refund. Do not interpret the audible 50% reference as a personal threshold.

Interview 03: Amrish Bhai

Evidence confidence: Low

What was heard: Discussed ixigo versus IRCTC, Tatkal and regular tickets, travel time and cost, booking for others, confirmation probability and 3X Refund. A 70% figure and a usage duration of roughly 4–6 years appear, but the exact context is uncertain.

Research use: Potential topics: transparent prediction, Tatkal experience, travel-time/cost trade-offs and refund education. Verify all numeric and comparative details against audio.

Interview 04: Diwakar

Evidence confidence: Low

What was heard: Active ixigo use is suggested. Family/father booking, WL/RAC, a possible 90% figure, 3X Refund and a fallback involving a general ticket were discussed. Hotels and flights also surfaced briefly.

Research use: Potential needs: clear WL/RAC status, prediction explanation, PNR updates and alternatives. Do not treat the general-ticket workaround as official policy.

Interview 05: Nitin Anuj

Evidence confidence: Low

What was heard: Active use is suggested. Last-minute versus advance booking, Mumbai-related travel, family travel, festival-season availability and WL/RAC alternatives were discussed. References to 99% and 70% are too unclear to interpret reliably.

Research use: Explore festival-season alternatives and clear distinction between predicted probability and actual confirmation. Numeric thresholds remain unverified.

Interview 06: Aditya

Evidence confidence: Good

What was heard: Has used ixigo for about two years; a January booking for a Varanasi journey is mentioned. Travels roughly once a year on a preferred route and estimates 5–6 tickets annually, including family bookings. Praises a clean, user-friendly, single-interface experience. Trusts predictions around 85–90%; prefers 2nd AC and comfort. If train options fail, considers flight or bus. Was unaware of 3X Refund until it was explained.

Research use: Improve discoverability of 3X Refund; explain prediction confidence; support comfort-led filters and alternative transport options.

Interview 07: Diwakar Durlabh

Evidence confidence: Medium–Low

What was heard: Active user; last use around September 2026 is mentioned. Route appears to involve Gujarat/Ahmedabad and Prayagraj/Allahabad, but origin is uncertain. Uses confirmation probability and 3X Refund; around 80% is described as a usual booking threshold. Prior refund experience is suggested.

Research use: Explain probability and refund eligibility/redemption; compare train, bus and flight. Verify exact route and refund experience.

Interview 08: Ashish Bro

Evidence confidence: Good

What was heard: Uses ixigo for train and flight bookings; values accessible information, user-friendly experience and offers. Preferred route Mumbai–Delhi; estimates 12–15 uses a year and books for family. Prefers 80%+ confirmation probability; often gets RAC. Prioritises journey duration and on-time performance (ideally 9–10 hours to Delhi), prefers night travel and suggests improving Tatkal. Sometimes checks IRCTC because he has noticed data discrepancies. Suggests a policy-compliant way for waitlisted online users to explore remaining accommodation after charting.

Research use: Investigate data freshness and trust, Tatkal usability, night-travel/duration filters and policy-compliant alternatives. His general-ticket/TTE workaround is a personal account, not policy advice.

Interview 09: Avi Anika

Evidence confidence: Good

What was heard: Aware of ixigo and downloaded/explored it but has never booked through it. Prefers the official IRCTC website. Familiar routes include Delhi–Prayagraj, Delhi–Lucknow and Delhi–Chandigarh. Occasionally uses Paytm to look for trains. Could not meaningfully evaluate ixigo UI from memory.

Research use: A non-user conversion case. Understand what value proposition, trust cues and first-booking support could motivate trial. Do not infer dislike of ixigo.

Interview 10: Anika

Evidence confidence: Good

What was heard: Knows ixigo but has not used it; uses MakeMyTrip. Frequent Delhi–Kanpur route. Says on-time arrival is the main train-selection priority. Would book only at 80%+ confirmation probability; if lower, would consider travelling by car.

Research use: Non-user perspective: punctuality information, confidence in predictions and alternative transport choices. No direct ixigo usability feedback was collected.

Interview 11: Alok Vishwakarma

Evidence confidence: Low

What was heard: Primarily uses IRCTC and finds it relatively easy. Mumbai–Patna/Patna–Mumbai route is mentioned. Frequent intercity travel, advance planning, Tatkal and bus alternatives were discussed. Sampoorna Kranti Express is named, but context is unclear.

Research use: Explore established IRCTC habits, advance planning and alternative transport. Usage of ixigo and booking lead time are uncertain.

Interview 12: Durlabh (possible duplicate of #07)

Evidence confidence: Low–Medium

What was heard: Says he checks information on ixigo but has not booked through it. Mentions concerns about terms, additional charges, refund method, vouchers and restrictions compared with direct IRCTC booking. Main route appears Patna–Delhi. Fastest train is a priority; Sampoorna Kranti Express is mentioned. 3X Refund and hotel options were discussed.

Research use: Potential conversion barrier: perceived fees and unclear refund/voucher terms. Keep separate as a record, but do not count as a distinct participant until identity is checked.

Interview 13: Priya Anup Sis

Evidence confidence: Good

What was heard: Active ixigo user; used it the previous month for train and flight bookings. Travel between Punjab and West Bengal is mentioned. Flight booked about a month ahead and return train through Tatkal. Books WL only at 80%+ probability. If uncertain, may try IRCTC/Premium Tatkal. Prefers faster trains and avoids inconvenient flight layovers. Satisfied and gave no specific improvement request.

Research use: Support fast-train discovery, festival alternatives and clear prediction information. Verify route/airport and duration comparison before quoting specifics.

Interview 14: Sayantika Sandeep Sis

Evidence confidence: Good

What was heard: Frequent ixigo user for train and flight bookings. Malda–Delhi/Delhi–Malda is mentioned. Strongly positive about smooth, convenient and user-friendly search. Uses around 80% confirmation probability, or may seek 90% when urgent. Plans ahead for Durga Puja and mentions Premium Tatkal.

Research use: Preserve the smooth experience; support advance planning, peak-season discovery and transparent confirmation information.

Interview 15: Sandeep Ghosh

Evidence confidence: Medium–Low

What was heard: Previously used ixigo but appears to have reduced regular usage because of login/account friction associated with railway booking. Likes the schedule UI and user-friendly aspects; accepts a service fee in principle. Prefers roughly 90–95% probability. Mentions a high-probability ticket that still did not confirm. Values 3X Refund and considers flight as an alternative.

Research use: High-priority usability issue: login reliability and booking continuity. Explain prediction uncertainty and 3X Refund terms. Exact login change and failed-ticket details need audio verification.

Interview 16: Anup Mondal

Evidence confidence: Medium–Low

What was heard: Has used ixigo and describes booking as good and smooth. Mentions booking for family and Bangalore–Kolkata travel. Values route options, timings and availability. Train is preferred when suitable seats are available; flights are an alternative. Tatkal/Premium Tatkal and confirmation percentages are discussed, but threshold is unclear. Mentions sorting/filtering options.

Research use: Improve sorting/filtering, availability visibility and multimodal alternatives. Do not attribute an 80% threshold to him.

Interview 17: Abhay TCI

Evidence confidence: Very Low

What was heard: IRCTC, train tracking and booking preferences are discussed. A general ticket is described as a last resort, with bus and flight also mentioned. Actual ixigo use and platform preference are not clear.

Research use: Exploratory only. Possible need for easy train tracking and alternative travel discovery; audio is too noisy for firm conclusions.

Interview 18: Yashveer

Evidence confidence: Low–Medium

What was heard: Has used ixigo for approximately 2–3 years but appears not to be a regular user. Says ixigo feels somewhat more complicated than IRCTC and not as user-friendly. Shiv Ganga Express, night travel, waiting-list analysis and PNR status are discussed.

Research use: Simplify booking flow for IRCTC-familiar users; improve PNR access, waitlist explanation and relevant filters. Route/frequency details are uncertain.

Interview 19: Abhilash (Jhunjhunun)

Evidence confidence: Low

What was heard: Appears to use ixigo for information but prefers direct IRCTC booking because it is the authorised railway platform. Varanasi–Delhi and Ambala–Delhi are mentioned. Departure time and seat availability are key considerations. Figures including 70%, 83–85% and 56% are discussed, but context is unclear.

Research use: Trust and conversion: explain booking process, make search-to-booking seamless and clarify prediction limitations. Do not assign a personal threshold.

Interview 20: Sushant

Evidence confidence: Very Low

What was heard: Uses or checks ixigo for train information; IRCTC is mentioned for booking. Bangalore–Darbhanga route is mentioned. Confirmation predictions around 75–80% and 40–50%, and 3X Refund/cashback, are discussed, but exact meaning and personal preferences are unclear.

Research use: Investigate information-to-booking conversion and refund comprehension. Treat all percentages and stated behaviours as low confidence.

Interview 21: Mamta Singh

Evidence confidence: Good (WhatsApp)

What was heard: Uses ixigo; most recent use was for flight booking a few months earlier. Has booked train tickets for herself and family, Mumbai–Agra, and mentions Rajdhani Express. Booked a waitlisted ticket at 95% prediction; it confirmed around four hours before departure. Says she books only above 90%. Reports no ticket failing to confirm; sometimes RAC. If no confirmed seat, prefers a flight over Tatkal. Priorities: time, safety and comfort. Rates ixigo 4/5.

Research use: Support high-confidence decision-making, chart/PNR updates and flight alternatives. This is a positive user rating, but one participant's rating is not a product-wide score.

5. UX opportunity areas and recommendations

The recommendations below are hypotheses to validate through usability testing, product analytics and policy review. They are not implementation requirements derived from a representative sample.

1. Make confirmation probability understandable and actionable

- Define what the percentage represents in plain language.
- Show that a prediction is not a guarantee and communicate uncertainty responsibly.
- Pair the prediction with the user's next-best choices: alternate trains, dates, routes or modes.
- Test comprehension at several probability levels and record whether users book, wait or switch.

2. Improve trust and booking completion

- Explain the booking process, payment state, ticket issuance and support path clearly.
- Audit account/login friction, especially repeat login and failed session recovery.
- Observe users who search on ixigo but complete booking on IRCTC or another app; identify the exact drop-off reason.
- Make fees and any additional charges visible before payment.

3. Make 3X Refund transparent

- Provide a concise eligibility summary before the user selects the offer.
- State what is refunded, in what form, when it is issued and how it can be redeemed.
- Explain exclusions, expiry, voucher limitations and any conditions in plain language.
- Test understanding with users who have never used the feature and those who have used it.

4. Design a practical alternative-journey experience

- Offer alternative trains and routes when the chosen train is unlikely to work for the traveller.
- Where supported, compare bus and flight options in the same decision context.
- Allow sorting by total journey time, departure/arrival time, price and convenience.
- Highlight layovers, transfers and overnight/daytime implications.

5. Improve train status and PNR confidence

- Show when status information was last updated, where appropriate.
- Use consistent language for WL, RAC, chart preparation and confirmed status.
- Investigate reported discrepancies against official/operational data before making product claims.
- Provide clear notifications for material status changes.

6. Reduce complexity for occasional and IRCTC-first users

- Test the booking flow with people who know IRCTC but rarely use ixigo.
- Use progressive disclosure so advanced features do not overwhelm the basic booking task.
- Make the primary next action visually obvious and reduce repeated data entry.
- Support easy return to a saved search or interrupted booking where feasible.

6. Suggested follow-up research

- At what exact point do IRCTC-first users decide not to complete booking on ixigo?
- Which trust cue matters most: official authorisation, payment security, ticket issuance, support, prediction reliability or familiarity?
- How do users interpret 70%, 80%, 90% and 95% confirmation probability? What do they believe the number guarantees?
- What do users expect 3X Refund to mean? Can they explain eligibility, amount, refund form and redemption without help?
- Which alternative is preferred when a train is uncertain: another train, another date, bus, flight or Tatkal? How does the answer change with urgency and budget?
- What is the most common login failure or repeated-login point, and how often does it lead to abandonment?
- How important are on-time performance and data freshness compared with scheduled journey duration?
- Do users want one universal sort order, or do they need personal priorities such as comfort, punctuality, price and duration?

7. Suggested usability test plan

Task	What to observe	Success signal
Find a train and interpret confirmation probability	Comprehension, confidence, perceived guarantee, decision	Participant explains the percentage accurately and chooses a next step
Compare a high- and low-probability waitlist option	Trade-offs, threshold, alternative selection	Participant can compare options without misleading certainty
Understand 3X Refund before booking	Eligibility, refund form, exclusions and redemption	Participant can explain what they will receive and under what conditions
Complete or resume a booking	Login friction, repeated entry, payment state and ticket confirmation	Participant completes task without confusion or unnecessary restart
Find an alternative when train is unavailable	Train/date/route/bus/flight switching	Participant finds a suitable alternative based on stated priorities
Check PNR and chart status	Status language, update freshness, notification expectations	Participant correctly understands current status and next action

8. Research caveats and data hygiene

- Record count: 21 interview records. Potential duplicate: Interview 7 and Interview 12 may be the same person (Diwakar Durlabh / Durlabh). Confirm identity before reporting unique participant count.
- Do not publish the percentage thresholds as ixigo model accuracy, conversion rates or statistically representative user behaviour.
- Do not create verbatim quotes from noisy speech recognition. Use paraphrases unless checked against the original audio.
- Interview #17 (Abhay TCI), #20 (Sushant), and several other low-quality transcripts should be revisited if their findings become central to a product decision.
- WhatsApp interview #21 (Mamta Singh) is clearer, but the response about priorities is partly cut off in the screenshot; the visible text supports time, safety and comfort.
- Interviewer-led explanations may have primed feature awareness or feedback. Separate spontaneous mentions from prompted reactions in any later analysis.
